measure up?

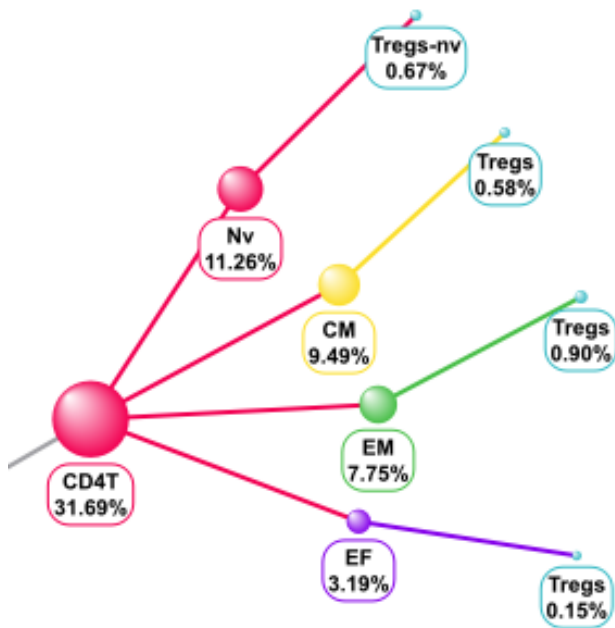

# gemstone<sup>2.0</sup>

GemStone™ is a revolutionary approach to high-dimensional flow, spectral, and mass cytometry data analysis. Based on patented Probability State Modeling™ technology\*, GemStone's approach is scalable, science-based, and reproducible.

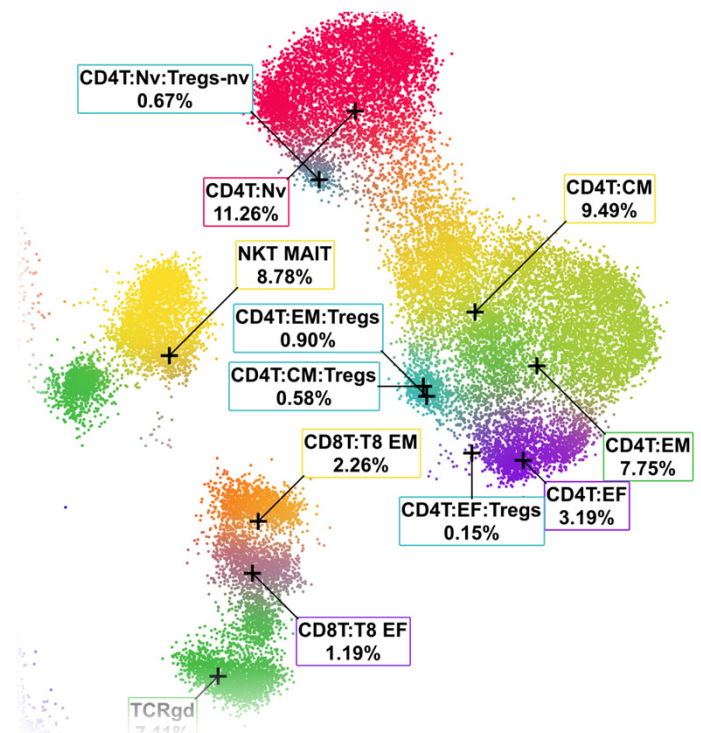

Simple wizards guide you through model development and automatically generate beautiful reports. Cen-se'™ and overlay plots reveal the hidden correlations in your data.

GemStone is built from the ground up for automated, high-dimensional analysis, integrating supervised and unsupervised approaches.

Force-directed map provides a visual summary of all populations and subsets defined in the supervised model.

High resolution Cen-se' cleanly identifies populations in an unsupervised, improved t-SNE labeled by the model.

\*US Patent 7,653,509, EU Patent EP2183681

# gemstone<sup>2.0</sup>

## Comfortable interface

Comfortable, like you already know how to use it.

## Probability-based

Forget gates. Let probabilities define your populations.

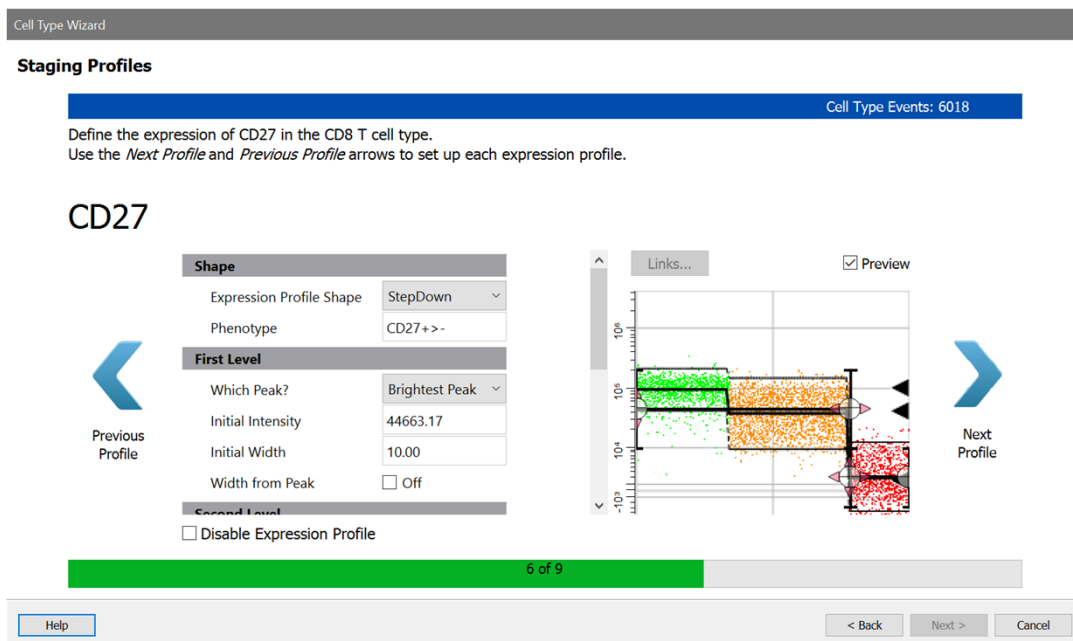

## Automated analysis

Design your model with wizards and you're ready to roll.

## Reproducible results

In study after study, everyone gets the same answers.

# gemstone<sup>2.0</sup>

## Understand your cells

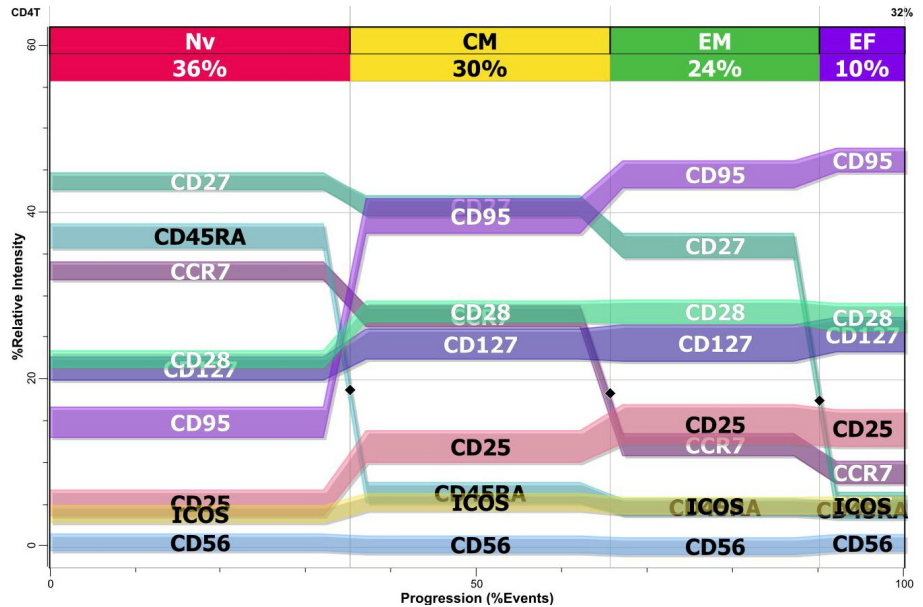

Coplot markers to see coordinated changes in expression.

## Export results

Easily integrates with LIS and spreadsheets.

## Best of both worlds

Leverage supervised and unsupervised analysis in one, integrated approach.

## Cen-se'

Faster than t-SNE, better than UMAP, and labeled.

## Share your work

Share your analysis with free GemStone Reader.

## Exploration tools

Interactively explore populations using animation to understand relationships.

# Features and Benefits

## Analysis

### Probability-based

Probability State Modeling is an objective, science-based approach.

### Reproducible

Different users at different sites get the *same* results.

### Cell type wizard

Identifying populations is a breeze, and report pages are created automatically.

### Batch files

Drop in your files and go! Easy, versatile, and automated batch processing.

### HD ready

From the ground up, GemStone is built for high dimensional data.

### Scalable

Adding a measurement only requires one additional plot in a cell type.

### Performance

An objective, statistical assessment of how well each cell type in the model is performing.

### Ratios

Create ratios and other calculated measurements quickly and easily.

## Automation

### Automatic analysis

Designed for automation, GemStone adjusts your model to your data, along with saving graphics, reports, and database.

### Unlimited files

Your experiment can be as large as you want!

### Easy batch setup

Choose batch options from simple selections.

### Save graphics

Export the graphics where you want them to go, in the format you want!

## Dimensionality Reduction

### Cen-se'

Based on t-SNE, the Cen-se' algorithm provides better separation and much better performance. You need to see 300,000 events? Not a problem.

### Automatic labels

Because Cen-se' is integrated with the model, it can display population labels on the plot automatically. No other solution provides this level of integration.

### High speed

Cen-se' is multi-threaded, allowing it to process more events in less time.

### Consistent locations

Cen-se' uses the model to determine where populations are oriented on the plot, so you'll find them in the same location each time you run the model.

## User Interface

### Project based

Keep all your project files together. FCS, PDF, graphics, templates, results - all within the same project.

### Ribbon interface

A ribbon with clean, vibrant, and meaningful icons makes finding what you want easy.

### Measurement wizard

Easily edit measurement names, setup transforms and scaling, and check staining.

### Context menus

Right-click any object to perform related actions.

## Quality Control

### Fully tested

Written under the strictest quality guidelines, GemStone doesn't go out the door until it passes extensive testing.

### Stain assessment

Select positive and negative populations for each stain and get detailed stain assessment plots and results.

### Alerts

Flag out-of-range values and missing measurements and include flags in reports.

### No double-counting

Each event belongs to one and only one cell type. You never have to worry about double-counting due to overlapping gate definitions.

### Built-in QC

Reduced Chi-Square for each cell type, customizable alerts for out-of-range stats, and a model performance table provide solid QC.

## Statistics and Database

### Custom equations

Create user-defined equations to compute additional statistics for reports and database.

### Database

GemStone creates a comprehensive database of results which can be automatically exported for integration with LIM systems.

### Statistics

Medians, means, SD, robust SD, event counts, percent of total, percent of cell type, SSMD, and more.

### Tables

Create tables to display results and sample information.

## Graphics

### Popular formats

Save graphics in PDF, SVG, PNG, JPG, and all other popular formats.

### Printing

Get high-quality hard copy of your reports at any printer resolution.

### PDF

Generate PDF output with user-defined resolution.

### Publication quality

Output in vector format with SVG, or up to 1200dpi for raster formats.

### Overlay plot

Unique to GemStone, the overlay plot allows visualization of correlated markers in one graph to examine changes in staging, timing of marker expression, and progression.

### Summary map

The summary map is a force-directed graph of all cell type populations, with labels and frequencies.

## Reports

### Automatic pages

The Cell Type wizard generates a clean and comprehensive report page for each population automatically.

### Customizable

A master page makes it easy to add logos and header text to all pages. All elements can be customized, and new elements added to any page.

### Comprehensive

Add 1P and bivariate plots, expression profiles, Cen-se', TriCOM™, and overlay plots. Other objects include tables, legends, text, lines, arrows, boxes, ellipses.

### Reusable

Report layouts can be saved and reused for other projects.

## Import and Export

### FCS files

Read all popular data file formats from major vendors.

### CSV files

Import data from CSV and tab-delimited text files.

### Export FCS

Export FCS files for further analysis in other software.

### Export database

The database can be exported in tab-delimited text format.

### Archive

Projects can be archived in ZIP format and tagged with keywords for later retrieval.

### Share projects

Projects can be easily shared with collaborators using the ZIP format.

## Support

### User guide

A comprehensive user guide with meaningful tutorials is included.

### Training

Contact us to find out when our next in-house training class will be or to arrange on-site training at your facility.

### Video tutorials

Check out our comprehensive library of video tutorials on YouTube.
